摘要（原文节选）

In the course of studying Diels – Alder reactions of 4-vinylimidazoles with N-phenylmaleimide, it was discovered that they engage in cycloaddition at room temperature to give high yields of the initial cycloadduct as a single stereoisomer. In certain cases, the product precipitated out of the reaction mixture and could be isolated by simple filtration, thereby avoiding issues with aromatization observed during chromatographic purification. Given these results, intramolecular variants using doubly activated dienophile ⋯

数据表 · Table 1（8 行，含数值行 7 行）

NMR yields for Diels – Alder reactions of vinylimimdazoles 1a – c with NPM as a function of time.

Entry	Compound	PG	Solvent	Time (Days)				
0	1	2	3	4	5	6	7	8
Percent Conversion (%) a								
1	1a	Bn b	CDCl3	0	20	40	55	66
2	1b	DMAS b	CDCl3	0	0	0	1	4
3	1b	MeOH-d4	0	7	14	18	21	23
4	1b	DMSO-d6	0	16	31	44	53	63
5	1c	SEM c	C6D6	0	30	48	59	68
6	1c		CDCl3	0	17	30	42	48

脚注（逐字）：a. Reactions were performed in an NMR tube and the course of the reaction monitored by NMR spectroscopy through integration of appropriate signals (see Supplementary Materials for details). b. Bn- and DMAS-protected Diels – Alder adducts precipitated out of solution when conducted in benzene with isol

正文对应句（逐字）：In all of these investigations, despite observing high diastereoselectivities, our lab has never before devoted much attention to investigating asymmetric variants of these reactions, even though the utility of such reactions is obvious. As part of an effort to identify strategies to develop asymmet
