摘要（原文节选）

Photoredox catalysis often relies on excited-state quenching data to rationalize performance, yet such metrics can obscure the impact of solvent cage escape on overall efficiency. We report a systematic study of the effect of electrostatic interactions on the excited-state quenching, cage escape, and back-electron transfer processes in a benchmark system comprising methyl viologen (MV2+) and differently carboxylated ruthenium polypyridyl complexes with net charges from 2+ to 4 – . Increasing electrostatic attraction ⋯

数据表 · 3（4 行，含数值行 4 行）

MV • + Production and Cage Escape Quantum Yields for the Ru – MV2+ Investigated Pairs

Photosensitizer	Φ Prod	1 – τ / τ 0	Φ CE
[Ru(bpy)3]2+	0.123	0.580	0.212
[Ru(bpy)2(dcbpy)]	0.060	0.485	0.124
[Ru(bpy)(dcbpy)2]2 –	0.044	0.517	0.085
[Ru(dcbpy)3]4 –	0.024	0.351	0.068

正文对应句（逐字）：The quantum yield of MV • + production Φ product was then determined by comparing the measured MV • + concentration with the number of absorbed photons (determined via transient actinometry, see SI for details). The calculation utilized the following equation, which is valid under the iso-absorbing cond
