摘要（原文节选）

6(5H)-phenanthridinone derivatives, as an important class of alkaloids, have broad application value in drug development and functional material synthesis. In this study, a nickel-catalyzed synthetic strategy was developed, using 2-bromobenzamide compounds as starting materials. Through an intermolecular cyclization reaction, a series of 6(5H)-phenanthridinone derivatives bearing amide substituents was efficiently constructed. The optimal reaction system was identified: Ni(acac)2/Zn as the catalyst, PCy3 as the lig ⋯

数据表 · Table 6（13 行，含数值行 13 行）

Summary of Phenanthridinone Derivatives Synthesized via Substrate Scope Expansion.

Entry	Substrate	Product	Yield (%)
1			88
2			89
3			92
4			75
5			79
6			58

12			80
13			51

正文对应句（逐字）：To optimize the catalytic system, a systematic screening was conducted under standardized conditions. Triphenylphosphine (PPh3, 10 mol%) served as the ligand to stabilize the nickel center via its electron-donating and steric properties, which can prevent the metal from decomposing or becoming inact
