摘要（原文节选）

Carbonyl olefinations are among the most important organic syntheses that form C=C bonds, as they usually have high yields and in addition offer excellent stereoselectivity. Due to these advantages, carbonyl olefinations have important pharmaceutical and industrial applications. These reactions contain an additional step of an α -functionalized carbanion to an aldehyde or ketone to produce alkenes, but syntheses performed using metal carbene complexes are also known. The Wittig reaction is an example of carbonyl ole ⋯

数据表 · Table 1（7 行，含数值行 7 行）

One-pot synthesis of unsaturated esters 25a – g [67].

R	Product	Yield (%)	Z:ERatio
	25a	85	94:6
	25b	81	95:5
	25c	91	89:11
	25d	90	100:0
	25e	86	92:8
	25f	87	76:24
	25g	21	90:10

正文对应句（逐字）：Phosphorus is an essential element in life, found in many biogenic molecules (DNA, RNA, and adenosine triphosphate (ATP)). Phosphorus is also found in many other important biomolecules, including cell membrane phospholipids such as sphingomyelin. There are also many examples of active pharmaceutical
